J. Mol. Biol. 208:587-599(1989).

-!-FUNCTION: Cytochrome c oxidase is the component of the respiratory chain that catalyzes the reduction of oxygen to water. Subunits 1-3 form the functional core of the enzyme complex. Subunit 2 transfers the electrons from cytochrome c via its binuclear copper A center to the bimetallic center of the catalytic subunit 1.

-!- CATALYTIC ACTIVITY: 4 ferrocytochrome c + 0(2) = 4 ferricytochrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SIMILARITY: Belongs to the cytochrome c oxidase subunit 2 family.

RT "Complete genome sequence of Salmonella enterica serovar Typhimurium
                                                                                                                                                                                                                                                                                                                  Gaps
biosynthesis (By similarity).
CATALYTIC ACTIVITY: S-adenosyl-L-methionine + 2-(3-carboxy-3-aminopropyl)-L-histidine = S-adenosyl-L-homocysteine + 2-[3-carboxy-3-(methylameonio)propyl]-L-histidine + 2-[3-Carboxy-3-(methylameonio)propyl]-L-histidine.
PATHWAY: Diphthamide biosynthesis; second step.
SIMILARITY: Belongs to the diphthine synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacteria, Proteobacteria, Gammaproteobacteria, Enterobacteriales,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        TWO Periprasmic transport proteins which interact with a common membrane receptor show extensive homology: complete nucleotide

-!- FUNCTION: Digests double-stranded RNA. Involved in the processing of ribosomal RNA precursors and of some mRNAS (By similarity).
-!- CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          phosphomonoester.
--- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
---- SIMILARITY: Contains 1 DRBM (double-stranded RNA-binding) domain.
---- SIMILARITY: Contains 1 RNase III domain.

"Rapid pole-to-pole oscillation of a protein required for directing division to the middle of Escherichia col;";

Proc. Natl. Acad. Sci. U.S.A. 96:4971-4976 (1999)

-!- FUNCTION: APPASE REQUIRED FOR THE CORRECT PLACEMENT OF THE DIVISION SITE. CELL DIVISION INHIBITORS MINC AND MIND ACT IN CONCERT TO FORM AN INHIBITOR CAPABLE OF BLOCKING FORMATION OF THE POLAR Z RING SEPTUMS. RAPIDLY OSCILLATES BETWEEN THE FOLES OF THE CELL TO DESTABLILIZE FYZZ FILAMENTS THAT HAVE FORMED BEFORE THEY MATURE INTO POLAR Z RINGS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                THYMOCYTE PROLIFERATION, & FIBROBLAST GROWTH FACTOR ACTIVITY.

IL-1 PROTEINS ARE INVOLVED IN THE INPLAMMATORY RESPONSE, BEING IDENTIFIED AS ENDOGENOUS PROGENS, AND ARE REPORTED TO STIMULATE INDENTIFIED TO STIMULATE SUBUNIT: MONOMEY.

SUBUNIT: MONOMEY.

DOMAIN: THE SIMILARITY AMONG THE IL-1 PRECURSORS SUGGESTS THAT THE MISSELLANDOUS SERVE SOME AS YET UNDEFINED FUNCTION. MISSELLANDOUS: THESE PROTEINS SERVE SOME AS YET UNDEFINED FUNCTION. MISSELLANDOUS: THE LACK OF A SPECIFIC HYDROPHOBIC SEGNENT IN THE PRECURSOR SEQUENCE SUGGESTS THAT IL-1 IS RELEASED BY DAMAGED CELLS.

OR IS SECRETED BY A MECHANISM DIFFERING FROM THAT USED FOR OTHER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Degrame Us 3-1-1-1-1 incl. 135-47;

Bidwai A.P., Reed J.C., Glover C.V.C.;

Biochem Kinse II of Saccharomyces cerevisiae contains two distinct regulatory submits, beta and beta.";

Arch. Biochem. Biophys. 309:348-355(1994).

-!- FINGTION: Plays a complex role in regulating the basal catalytic activity of the alpha submint (By similarity).

-!- SUBUNIT: Tetramer composed of an alpha chain, an alpha', one beta chain and one beta chain.

-!- FINK: Phosphorylated by alpha chain (By similarity).

-!- SIMILARITY: Belongs to the casein kinase 2 beta chain family.

Science 299:2074-2076(2003).
-!- FUNCTION: Catalyzes the formation of N(7)-methylguanine at position 46 (#7646) in tRNA (By similarity).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + tRNA = S-adenosyl-L-homocysteine + tRNA containing N(7)-methylguanine.
-!- SIMILARITY: Belongs to the methyltransferase superfamily. TrmB

-!- CATALYTIC ACTIVITY: S-adenosylmethioninamine + putrescine = 5'--
methylthicadenosine + spermidine.
-!- PATHWAY: Spermidine biosynthesis; fifth (last) step.
-!- PATHWAY: Belongs to the spermidine/spermine synthase family.

MINCLEOTIVE SEQUENCE and expression analysis of the Acetobacter xylinum uridine diphosphoglucose pyrophosphorylase gene.";
J. Bacteriol. 173:7042-7045(1991).
-:- CATALYTIC ACTIVITY: UTP + alpha-D-glucose 1-phosphate = diphosphate + UDF-glucose.
-:- SIMILARITY: Belongs to the prokaryotic UDPGP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

-!- CATALYTIC ACTIVITY: dTTP + alpha-D-glucose 1-phosphate =
diphosphate + dTDP-glucose.
-!- PATHWAY: RHAMNOSE BIOSYNTHESIS WITHIN THE O ANTIGEN BIOSYNTHESIS
PATHWAY OF LIPPOPLYSACCHARIDE BIOSYNTHESIS.
-!- SIMILARITY: Belongs to the glucose-1-phosphate
thymidylyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STRAIN=B1940 / Serogroup B;

Natl. Acad. Sci. U.S.A. 99:14434-14439 (2002).
-!- CATALYTIC ACTIVITY: dTTP + alpha-D-glucose 1-phosphate diphosphate + dTMP-glucose.
-!- PATHWAY: dTDP-L-rhamnose biosynthesis.
-!- PATHWAY: Belongs to the glucose-1-phosphate thymidylyltransferase family.
                                                                                                                                                                                                                                                                                                                                   Score 25; DB 1; Length 288; Pred. Mol. Pharmacol. 42:265-272(1992).

-!- FUNCTION: Participates in the detoxification of a plethora of hydrazine and arylamine drugs. 2-aminofluorene and p-aminobenzoic acid (PABA) are preferred substrates for NAT-2. Less activity with anisidine and barely detectable with SMZ.

-!- CATALYTIC ACTIVITY: Acetyl-CoA + an arylamine = CoA + an N-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -!- SUBCELLUIAR LOCATION: Cytoplasmic.
-!- POLYMORPHISM: There are two forms of NAT2: a rapid/stable isoform (Asn-99) and a slow/unstable isoform (Ile-99).
-!- SIMILARITY: Belongs to the arylamine N-acetyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=92382565; PubMed=1513324; Martell K.J., Levy G.N., Weber W.W.; Martell K.J., Levy G.N., Weber W.W.; "Cloned mouse N-acetyltransferases: enzymatic properties of expressed
                                                                                                                                                                                                                                                                            01-0CT-1996 (Rel. 34, Created)

-!- FUNCTION: Unusual circulary permuted GTPase that catalyzes rapid hydrolysis of GTP with a slow catalytic turnover (By similarity).
-!- SUBUNIT: Monomer (Probable).
-!- SIMILARITY: Contains 1 engC GTPase domain.
                                                                                                                                                                                                                                                  PETRAIN-MULSO (ATC. 700699, and N315; MEDLINE-21311952; PubMed=11418146; Kurdad M., Otha T., Uchiyama I., Baba T., Yuzawa H., Kobayashi I., Cui L., Oguchi A., Aoki K.-I., Nagai Y., Lian J.-O., Ito T., Kanamori M., Matsumaru H., Maruyama A., Murakami H., Hosoyama A., Mutatani-Ui Y., Takahashi N.K., Sawano T., Inoue R.-I., Kaito C., Sekimizu K., Hirakawa H., Kuhara S., Goto S., Yabuzaki J., Kanehisa M., Yamashita A., Oshima K., Furuya K., Yoshino C., Shiba Hattori M., Ogasawara N., Hayashi H., Hiramatsu K.; Whiba S., Wabusaki J., Mulatori M., Ogasawara G., Raito II., Firamatsu K.; Wattori M., Ogasawara N., Hayashi H., Hiramatsu K.; Shiba W., Manani S., Wabusaki J., Kanen Sequencing of meticillin-resistant Staphylococcus

-!- CATALYTIC ACTIVITY: a(TTP + alpha-D-glucose 1-phosphate = diphosphate + dTDP-glucose.

-!- PATHWAY: DTDP-L-RHAMNOSE BIOSYNTHESIS WITHIN THE O ANTIGEN BIOSYNTHESIS PATHWAY OF LIPOPOLYSACCHARIDE BIOSYNTHESIS.

-!- SIMILARITY: Belongs to the glucose-1-phosphate thymidylyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  11065BA9DF2B0268 CRC64;

J. Bacteriol. 175:3408-3413(1993).
-!- CATALYTIC ACTIVITY: dTTP + alpha-D-glucose 1-phosphate = diphosphate + dTDP-glucose Blucose.
-!- PATHWAY: DTDP-L-FHAMNOSE BLOSYNTHESIS WITHIN THE O ANTIGEN BLOSYNTHESIS PATHWAY OF LIPOPOLYSACCHARIDE BLOSYNTHESIS.
-!- SIMILARITY: Belongs to the glucose-1-phosphate
.

-!- PATHWAY: Coenzyme A (COA) biosynthesis; first step.
-!- SUBCELDULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the prokaryotic pantothenate kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SEQUENCE FROM N.A.

Malate dehydrogenase from the thermophilic green bacterium chloroflexus aurantiacus: purification, molecular weight, amino acid composition, and partial amino acid sequence.";

J. Bacteriol. 170:2947-2953(1988).

-!- CATALYTIC ACITIVITY: (S)-malate + NAD(+) = oxaloacetate + NADH.

-!- CATALYTIC ACITIVITY: (S)-malate + NAD(+) = toxaloacetate + NADH.

AT TEMPERATURES LOWER HAAN 55 DEGREES CELSIUS (INACTIVE FORMS).

-!- SIMILARITY: Belongs to the LDH family. MDH subfamily.

PIT: Phosphorylated in vitro on serine(s) and threonine(s) by PKC. SIMILARITY: Belongs to the annexin family.

SIMILARITY: Contains 4 annexin repeats.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             {RNA}(N).
--- SUBUNIT: Homodimer. The RNAP catalytic core consists of 2 alpha, 1
beta, 1 beta' and 1 omega subunit (By similarity).
--- DOMAIN: The N-tendinal domain is essential for RNAP assembly and
basal transcription, whereas the C-terminal domain is involved in
interaction with transcriptional regulators and with upstream
promoter elements (By similarity).
--- SIMILARITY: Belongs to the RNA polymerase alpha chain family.

MISCELLANBOUS: There are two kinds of Fc receptors for 1gE, which differ in both structure and function: high affinity receptors on basophils and mast cells and low affinity receptors on lymphocytes
"Structure-based modeling of the ligand binding domain of the human cell surface receptor CD23 and comparison of two independently derived molecular models.";

Protein Sci. 5:20-47(1996).

-!- FUNCTION: This receptor has essential roles in the regulation of IGE production and in the differentiation of B-cells (it is a B-cell-specific antigen).

-!- SUBCELBUAR LOCATION: TYPE II MEMBRANE PROTEIN, ALSO EXISTS AS A SOLUBLE EXCRETED FORM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CYTOPLASMIC (POTENTIAL).

Transcription regulation; Repeat; Zinc-finger; Metal-binding; Zinc;
FUNCTION: Stabilizes TBP binding to an archaeal box-A promoter. Also responsible for recruiting RNA polymerase II to the preintintation complex (DNA-TBP-TFIB) (By similarity).

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

SIMILARITY: Belongs to the TFIIB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SEQUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                     ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NAD(+) = 3-carboxy-4-methyl-2-oxopentanoate + NADH.
-!- PATHWAY: Leucine biosynthesis; third step.
-!- SUBUNIT: Homotetramer (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: Belongs to the isocitrate and isopropylmalate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Methanobacterium thermoautotrophicum.
